Summary
Influenza activity remains below baseline estimates. No indicators for severity among cases identified. Minimal impact on active duty service members; active duty vaccination continues to increase week to week.

Influenza Activity and Surveillance

Laboratory:  
Two laboratory positive influenza cases were identified during Week 43, below baseline. More

Antivirals (AVs):  
15 AV medications were dispensed in Week 43, below baseline. More

Influenza-Like Illness (ILI):  
Overall, 3.2% of outpatient medical encounters were due to ILI, equal to baseline. More

Severity Indicators

Inpatient:  
This week, zero laboratory positive cases and inpatient antiviral prescriptions were identified. There were no inpatient cases reported to DRSi. More

Coinfections:  
The cumulative proportion of laboratory-positive cases with a bacterial coinfection remains below baseline; zero new coinfections were identified this week. More

Vaccination Rates
Active duty only

Navy: 51.2%  
Marine Corps: 26.6%  
US Fleet Forces: 59.2%  
More

Source: MRRS, current as of 02 Nov 2015.

Select Populations

Active Duty & Recruits:  
In Week 43, no laboratory positive cases and six AV prescriptions dispensed were among active duty personnel. There were no laboratory positive tests or AV prescriptions dispensed to recruits. More

NHRC reports febrile respiratory illness (FRI) rates were at or below expected value during Week 42 at MCRD San Diego, MCRD Parris Island, and NRTC Great Lakes. More

Children:  
The rate of influenza positive laboratory cases and influenza specific AV prescriptions in children remains low. More

Case Identification

The overall burden of influenza in the DON is estimated by combining three major sources of data: certified laboratory results, antiviral pharmacy transactions, and medical encounters with influenza-specific diagnoses.

- This week, there were 27 DON cases identified in one or more data sources; pharmacy captured the highest proportion of cases (51.9%). Zero of this week’s cases were identified in all three sources.
- Since Week 40, there have been 170 DON cases identified in at least one of the three data sources.

Laboratory

Case Frequencies

- Two laboratory positive influenza cases were identified during Week 43 (both type B), below baseline estimates.
  - Two cases were identified at NH Lemoore and Naval Health Clinic New England.
- Since Week 40, 24 laboratory positive cases were identified among DON beneficiaries. Top facilities: NHC Hawaii (5), NH Camp Lejeune (3), and AMC-Tripler Shafter (2), NH Lemoore (2), NMC San Diego (2).

Specimen Positivity

- 0.7% of all influenza specimens tested during Week 43 were positive, lower than last season (5.0%).
- When grouped by parent facility, ten (35.7%) locations tested more than ten specimens; none of these facilities testing more than ten specimens had positive results.

Antivirals

- 15 antiviral prescriptions were dispensed during week 43, below baseline estimates.
  - Most common facilities this week: NH Camp Lejeune (4), 6th Med Grp-Macdill (2), NMC San Diego (2).
- Since Week 40, the majority (98.1%) of prescriptions were for Oseltamivir.

Influenza-Like Illness
- The percent of medical encounters that included an ILI diagnosis during Week 42 (lagged due to data availability):
  - 3.2% of outpatient (equal to baseline)
  - 9.9% of ER (below baseline).
- When grouped by parent facility, eight DON facilities (28.6%) experienced an increase in the proportion of outpatient ILI visits during Week 42; one facility (NHC Patuxent River) experienced an increase above 25%.

Severity Indicators

Inpatient Laboratory
- None of the 25 specimens tested for influenza in the inpatient setting were positive this week.

Inpatient Pharmacy
- Zero AV prescriptions during Week 43 were in the inpatient setting (below baseline).

Influenza-Associated Hospitalization Reports
- There have been no influenza-associated hospitalizations reported to DRSi this season.

Coinfections
- The percent of cases with bacterial coinfections this season (4.2%) remains below baseline (6.2%).
- One coinfection was identified so far this season.
  - The coinfection was identified in an outpatient setting as a lower respiratory *Mycobacterium* infection influenza positive during Week 41.
Active Duty
- There were no laboratory positive influenza cases among active duty service members in Week 43.
- Two active duty service members (one Marine Corps, one Navy) have been identified this season (during Week 41); one service member received a vaccine more than 14 days prior to infection and one was vaccinated less than 14 days prior to infection.
- Six active duty service members (3 Navy, 2 Marine Corps) were dispensed oseltamivir during Week 43 at six different facilities.

Recruits
- There were no laboratory positive influenza cases among recruits in Week 43.
- There were no AVs dispensed to recruits during Week 43.

Children
- The rate of laboratory positive influenza cases remains low for all age groups.
- One laboratory positive influenza case was identified among children during Week 43, below baseline estimates for children.
  - This week’s case aged 5-17 years from an outpatient setting at NH Lemoore.
- The rate of AV prescriptions remains low for all age groups.
- There were four AVs dispensed to children during Week 43, below baseline estimates for children.
  - This week’s cases were all outpatient with two children ages 0-4 and two ages 5-17 at NH Camp Lejeune (2), NH Twentynine Palms (1), and NHC Quantico (1).
