Overall Summary
Laboratory, pharmacy, and influenza-like-illness trends are below baseline. Impact for active duty personnel remains minimal. Navy active duty vaccination rates surpassed 90%.

Key Findings

Influenza Activity and Surveillance

Laboratory
10 laboratory positive influenza cases were identified during Week 51, below baseline. Details

Antivirals (AVs)
38 AV medications were dispensed in Week 51, below baseline. Details

Influenza-Like Illness (ILI)
Overall, 4.3% of outpatient medical encounters were due to ILI, below baseline. Details

Severity Indicators

Inpatient
This week, there were no inpatient laboratory positive cases and four inpatient antiviral prescriptions were identified. There were no inpatient cases reported to DRSi. Details

Coinfections
There were no bacterial coinfections identified among laboratory positive cases during Week 51. Details

Select Populations

Active Duty and Recruits
In Week 51, one laboratory positive case and eight dispensed AV prescriptions were among active duty personnel. Details

Most current NHRC surveillance reports febrile respiratory illness rates were at or below expected values at MCRD San Diego, MCRD Parris Island and NRTC Great Lakes. Details

Children
The rates of influenza positive laboratory cases and influenza specific AV prescriptions in children remain low. Details

Active Duty Vaccination Rates
Navy: 90.8%
Marine Corps: 88.1%
US Fleet Forces: 96.5%

Influenza Activity and Surveillance

Overall Burden
The estimated burden of influenza across the DON combines three major sources of data: certified laboratory results, antiviral pharmacy transactions, and medical encounters with influenza-specific diagnoses.

- During Week 51, there were 49 DON cases identified in one or more data sources; pharmacy captured the highest proportion of cases (62.1%). No cases were identified in all three sources.
- Since Week 40, there have been 700 DON cases identified in at least one of the three data sources.

Laboratory Cases
- Ten laboratory positive influenza cases were identified during Week 51 (seven type A, three type B); below baseline estimates.
- Three cases during Week 51 were identified at NMC San Diego, two at NH Camp Lejeune, and one each at NH Lemoore, NH Twentynine Palms, 88th Med Grp Wright Patterson, NH Oak Harbor, and NH Okinawa.
- Since Week 40, 96 laboratory positive cases were identified among DON beneficiaries. Top facilities thus far: NMC San Diego (15), NH Lemoore (12), NH Camp Lejeune (12), and NHC Hawaii (7).

Specimen Positivity
- 3.8% of all influenza specimens tested during Week 51 were positive, lower than last season (28.0%).
- When grouped by parent facility, seven (25.0%) locations tested more than ten specimens; specimens from two of these facilities had positive results. NMC San Diego had the highest percent positive (7.5%) during Week 51.

Antiviral Prescriptions
- 38 antiviral prescriptions were dispensed during Week 51, below baseline estimates.
- Most common facilities this week: NMC San Diego (7), NH Camp Pendleton (4), and NMC Portsmouth (4).
- Since Week 40, the majority (97.7%) of prescriptions were for Oseltamivir.

**Syndromic Surveillance**

**Influenza-Like Illness (ILI)**
- The percent of medical encounters that included an ILI diagnosis during Week 50 (lagged due to data availability):
  - 4.3% of outpatient (below baseline)
  - 14.1% of ER (below baseline)
- When grouped by parent facility, 19 DON facilities (67.9%) experienced an increase in the proportion of outpatient ILI visits during Week 50; two facilities experienced an increase above 25.0% (NH Naples, NH Rota).

**Severity Indicators**

**Inpatient Laboratory**
- There were no laboratory cases in the inpatient setting during Week 51.

**Inpatient Pharmacy**
- Four (10.5%) AV prescriptions were in the inpatient setting during Week 51 (above baseline).
- This week’s inpatient cases were 18-44 (2) and 45+ (2) years old at three different facilities.

**Influenza-Associated Hospitalization Reports**
- There were no inpatient cases reported to DRSi this week.

**Bacterial Coinfections**
- No coinfections were identified during Week 51.
- Though overall case counts remain low, the percent of laboratory positive cases with a coinfection this season (5.9%) is almost twice baseline with a higher proportion than expected from lower respiratory specimens.

< Back to Key Findings
Active Duty

- One laboratory positive influenza case was identified among active duty service members during Week 51. This week’s case was a male Marine Corps service member with influenza type A in an outpatient setting at NMC San Diego.
- Eight active duty service members (5 Navy, 3 Marines) were dispensed AVs (1 amantadine, 7 oseltamivir) during Week 51; three of these were at NMC Portsmouth, two at NH Twentynine Palms, and one each at three different facilities.

Recruits

- There were no laboratory positive influenza cases among recruits during Week 51.
- There were no AVs dispensed to recruits during Week 51.

Children

- The rate of laboratory positive influenza cases and AV prescriptions remains low for all age groups.
- Two laboratory positive influenza cases were identified among children during Week 51, below baseline estimates for children.
  - This week’s cases (influenza type A) were one 0-4 year old child and one 5-17 year old child in outpatient settings at NH Camp Lejeune.
- There were six AVs dispensed to children during Week 51, below baseline estimates for children.
  - This week’s cases (all oseltamivir) were five 0-4 year old children and one 5-17 year old child. Two of these cases were from NH Beaufort.

In the News

- During the week ending December 19, outpatient visits for influenza-like illness in the United States rose above 2.2%, surpassing the national baseline of 2.1% for the first time this season. [Details]
