Influenza in the DoD

Defense Health Agency, Public Health Division, Armed Forces Health Surveillance Branch, AF Satellite and
USAF School of Aerospace Medicine, Department of Public Health
Presented by: DoD Global, Laboratory-based, Influenza Surveillance Program
Lt Col Federinko, MD, MPH, Gregory Wolff, MPH, Kristine Fumia, Liz Toure, MPH
DSN: 798-3196 (Comm: 937 938-3196)
27 September 2016
Influenza Outline

I. About Influenza
   I. Clinical Information
   II. Subtypes and Strains
   III. Immunity-related Changes: Antigenic Drift/Shift
   IV. Vaccine
   V. Vaccine Effectiveness
   VI. Influenza Testing

II. Influenza Surveillance in Military Populations
   I. Reportable Medical Event Case Definition
   II. Influenza-like Illness (ESSENCE)
   III. Surveillance Activities by Service

III. Contact Information
Clinical Information

- An acute viral disease of the respiratory tract
  - Fever, cough, sore throat, runny nose, headache, fatigue, body aches
- Spread by droplets or touching contaminated surfaces
- Incubation period is 1-4 days (2 days on average)
- Contagious 1 day prior, and up to 5-7 days after symptom onset (longer for children & immunocompromised)
- Severity depends on flu virus, vaccination status, and health status
- Recovery: few days to two weeks (1 week on average)
**Subtypes and Strains**

**Influenza A**
- Evolves rapidly & responsible for most epidemics and pandemics
- **Subtypes:**
  - Divided into subtypes based on two surface proteins:
    - Hemagglutinin (HA)
    - Neuraminidase (NA)
  - Combine to create a single subtype (Example: H5N1, H1N1)
  - Are further divided into strains
- Found in many different animals

**Influenza B**
- Gradually changing virus
- Classified by strains based on their lineage:
  - Examples are Yamagata and Phuket
- Found primarily in humans
- May cause epidemics, but not pandemics
Antigenic Drift

• Immunity-related changes to influenza A virus
  – Changes to regions of the HA surface protein can affect human antibody responses to the virus

• Antigenic Drift
  – Small gradual changes that occur over time and create a new strain that may not be recognized by immune system
    • Reason that new influenza vaccine is manufactured and distributed each year
  – USAFSAM conducts molecular sequence analysis on influenza specimens to monitor these changes
Antigenic Shift

• Antigenic Shift
  – Abrupt major change that produces a novel (not seen previously in humans) influenza A virus, for example H5N1
  – Result of direct animal-to-human transmission or mixing of human and animal viral genes within the same individual (reassortment)
  – Most people have little or no protection against the new virus

• Example
  -2009 influenza A(H1N1)pdm09
• Get Vaccinated Early
  – Flu seasons can be unpredictable and begin as early as October
  – Takes about 2 weeks for antibody production after vaccination
  – Influenza vaccine cannot give you influenza
    – Vaccine contains inactivated (killed) or attenuated (weakened) virus

• This year, DoD ordered over 3.5M doses of trivalent and quadrivalent (injection) vaccines for service members and beneficiaries
  – Trivalent: A(H3N2), A(H1N1)pdm09, B/Victoria
  – Quadrivalent: A(H3N2), A(H1N1)pdm09, B/Victoria, B/Yamagata

*Note: LAIV (FluMist) was not ordered – more on this in upcoming slides
Annual Influenza Vaccine Manufacturing Timeline for entire US Supply

- **Strain Selection**
  - CDC
  - FDA
  - WHO
- **Surveillance & Reassortants**
- **Production (at risk)**
- **Production (may be at risk)**
- **Produce Working Seed**
- **Strain Balancing**
- **Formulation**
- **Filling & Packaging**
- **Distribution**

- **~6 Months to produce ~140 Million doses**
  - 2 weeks of production = >10 Million doses
- **~4 Months to vaccinate ~140 Million people**
  - 2 weeks represents >16 Million vaccinations

---

Industry Comments, VRBPAC 04 March 2015
Vaccine Effectiveness

• **Vaccine Effectiveness (VE)**
  – Determine how well the vaccine protects against influenza
  – VE estimates are calculated for each influenza season
  – Results may vary depending on study design, outcome, population, and flu season

• **USAFSAM 2015-2016 Mid-Season VE Analyses**
  – Test-negative case-control study design
  – Population: DoD healthcare beneficiaries (excluding Active Duty members)
    • Cases: confirmed by RT-PCR, viral culture, or FilmArray®
    • Controls: test-negative for influenza
    • Matched by surveillance week
  – Analyses by beneficiary group (children, adults) and vaccine type (overall, IIV, LAIV)
  – Odds ratio (OR) and 95% confidence intervals (CIs) were calculated using conditional multivariable logistic regression adjusted for age, gender, and region
    • VE = (1-OR) x 100%
Vaccine Effectiveness

USAFSAM Mid-season 2015-2016 Influenza (VE) Estimates

Children (<18) and Adult (18+)

Adjusted Vaccine Effectiveness (%)

</table>
New guidelines: Due to the low effectiveness of LAIV in recent seasons, ACIP made the interim recommendation that LAIV should not be used for the 2016-2017 season.
Testing for Influenza

• Rapid Influenza Diagnostic Tests (RIDTs)
  – Fast & easy but.....
    • High specificity (correctly identifies negatives)
    • Low sensitivity (does not pick up positives very well)
    • Accuracy depends on the prevalence of circulating viruses

• Confirmatory Tests
  – Much more sensitive & specific
  – Common
    • RT-PCR detection (24-48 hours)
    • Tissue cell culture (up to 10 days for negative result)
  – Others
    • Immunofluorescent antibody staining (IFA) antigen detection
    • Hemagglutination inhibition (HI) 4-fold rise in antibody titer in paired acute and convalescent sera
    • Immunohistochemical (IHC) staining antigen detection (autopsy)
Sequencing

**USAFSAM**
- Isolates analyzed; Sanger Sequencing for full Hemagglutinin (HA), Neuraminidase (NA), and Matrix genes
- Uses Pyrosequencing to screen for antiviral (Oseltamivir) resistance
- Acquiring Next Generation Sequencing (NGS) technology for whole genome sequencing

**VRBPAC** (Vaccine and Related Biological Products Advisory Committee) determines influenza vaccine components

**CDC’s Influenza Division**
Influenza A/H3 Phylogenetic Tree

- Mid-season H3N2 phylogenetic tree from HA gene sequence data
  - Demonstrates the “antigenic drift” of influenza viruses isolated from respiratory specimens collected from December 2015 through March 2016
  - DoD and CDC’s sequence data facilitate VRBPAC’s vaccine component decision

2015-2016 Influenza A(H3N2) Vaccine strain: A/Swine/1/2015
Reference strain: A/Victoria/3/2011
Mid-season H3N2 phylogenetic tree from HA gene sequence data

- Demonstrates the “antigenic drift” of influenza viruses isolated from respiratory specimens collected from December 2015 through March 2016
- DoD and CDC’s sequence data facilitate VRBPAC’s vaccine component decision
Influenza Surveillance

• Surveillance in military populations

• Varied approaches
  – Reportable Medical Events (RME)
  – Syndromic
  – Sentinel – AF
  – Shipboard, Recruit, & Population - Navy
  – Population – Army
Influenza and Military Populations

• Even with modern medical advances, influenza and influenza-like illness can cause high morbidity rates, undermining readiness

• Military members and their families:
  • Are stationed where new strains are likely to appear
  • Are highly mobile across the globe and could quickly spread a pandemic strain
  • May live in areas that represent "gaps" in the World Health Organization (WHO)/Centers for Disease Control and Prevention (CDC) influenza surveillance network

• Training environments are well suited for the spread of emerging respiratory pathogens

• Highly immunized military plus electronic vaccination data registry facilitate rapid assessment of vaccine protection against emerging strains
Reportable Medical Events (RMEs)

• “A reportable event may represent an inherent, significant threat to public health and military operation. These events have the potential to affect large numbers of people, to be widely transmitted within a population, to have severe/life threatening clinical manifestations, and to disrupt military training and deployment. Timely accurate reporting of probable, suspected or confirmed cases ensures proper identification, treatment, control, and follow-up of cases”

• DRSi
  – Web-based application
  – Identify, collect, document, manage, and track information on RMEs
  – Completeness/timeliness of data is user-driven
### Influenza-associated Hospitalization

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>Included population</td>
<td>&lt; 65 years of age</td>
</tr>
<tr>
<td></td>
<td>Any beneficiary type/mandate status</td>
</tr>
<tr>
<td>Patient status</td>
<td>Influenza-associated hospitalization</td>
</tr>
<tr>
<td></td>
<td>Fever ≥ 100.5°F with cough or sore throat in absence of other diagnosis</td>
</tr>
<tr>
<td>Laboratory</td>
<td>Positive rapid or confirmatory test (RT-PCR, culture, IFA, IHC, HI titer)</td>
</tr>
<tr>
<td></td>
<td>&lt; 4 days after hospital admission</td>
</tr>
</tbody>
</table>

### Case Classification

<table>
<thead>
<tr>
<th>Case Classification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Confirmed</td>
<td>Meet population and patient status criteria with positive confirmatory lab test</td>
</tr>
<tr>
<td>Probable</td>
<td>Meeting population and patient status criteria with positive rapid antigen test</td>
</tr>
</tbody>
</table>

### Notes

For all confirmed cases, a nasal wash specimen should be submitted to an appropriate lab for further influenza lab testing (i.e. sequencing)
ILI Syndromic Surveillance

- Electronic Surveillance System for the Early Notification of Community-based Epidemics (ESSENCE)
  - Designed by Johns Hopkins University Applied Physics Laboratory and DoD
  - Internet-based syndromic disease surveillance system
  - Used by DoD and many civilian health departments
- Useful for early detection with maximum sensitivity
  - Often at the cost of specificity (false alerts)
ILI Syndromic Surveillance

- **ILI**
  - Includes ICD, CPT and Chief Complaint data
- **Influenza Specific**
  - Influenza specific ICD codes only

For more information on ESSENCE, please refer to
[https://gumbo2.wpafb.af.mil/epi-consult/enhanced/](https://gumbo2.wpafb.af.mil/epi-consult/enhanced/)
DoD Global, Lab-based, Influenza Surveillance Program

- **AF Influenza Program “Project Gargle”: 1976-1997**
- **National Science and Technology Council Presidential Decision Directive (NSTC PDD-7)**
  - U.S. not prepared for threat posed by emerging infectious diseases
  - Action taken and AF was assigned lead executive agent for DoD influenza surveillance
- **DoD Global, Lab-based Influenza Surveillance Program: 1998 – present**
  - Sentinel-based, across services
    - Selected according to mission, location, gap in international surveillance
  - Collect 6-10 specimens/week meeting ILI case definition
  - Complete patient information on influenza surveillance questionnaire
  - Submit specimens and questionnaires to the USAFSAM lab
DoD Global, Lab-based, Influenza Surveillance Program

- USAFSAM provides collection kits to sentinel and participating sites

- Nasal wash collection kit
  - Questionnaire
  - Syringe
  - Collection cup
  - VTM vial
  - Biohazard bag
  - Bib
Sentinel Surveillance Sites 2016-2017

**CONUS Sites: 59**
- Air Force: 33
- Army: 11
- Navy & Marine Corps: 7
- Coast Guard: 6
- JTF CAPMED/DHA: 2

**OCONUS Sites: 36**
- Air Force: 18
- Army: 9
- Navy & Marine Corps: 7
- Coast Guard: 2
Prevent Influenza Infections
Reduce Morbidity & Mortality
Force Health Protection

Identify current strains & outbreaks
Analyze vaccine effectiveness
Track genetic changes of viruses in circulation (molecular sequence analysis)
Detect and monitor antiviral resistance
Contribute to annual vaccine selection
Monitor severity trends

DoD Global, Lab-based, Influenza Surveillance Program
Surveillance Process and Vaccine Development

FDA's VRBPAC* meets to decide strains for annual flu vaccine

Sentinel Sites

DoD Influenza Surveillance

Participating Non-Sentinel Sites

CDC/Viral Surveillance

National Respiratory & Enteric Virus Surveillance System Labs (U.S.)

WHO Influenza Labs

DoD System

Civilian System

DoD Global, Lab-based, Influenza Surveillance Program

• Site-specific surveillance dashboard
  ✓ Submission data
  ✓ POC information
  ✓ Shipping/storage
• Welcome packet
• Weekly reports
• Other sentinel site resources
• Novel virus information
• Historical data
• Program publications

Note: If you would like to receive these reports by email, send a request to the program at: usafsam.phrflu@us.af.mil
Influenza Dashboard

- Online dashboard that displays base-level information
  - Submission data
  - POC information
  - Shipping & storage information

Navy Influenza Surveillance Activities

• Shipboard and Recruit ILI surveillance
  – Fleet Disease and Injury Surveillance (D&I)
  – Naval Health Research Center (NHRC) FRI program

• Participate in USAFSAM sentinel surveillance program

• NMCPHC Epi Data Center Influenza SITREPs

• NMCPHC Influenza Advisory
  – Guide to tracking pneumonia in ESSENCE
Navy Influenza Surveillance Activities

• Fleet D&I surveillance (formerly known as DNBI)
  – Shift from weekly reporting of xls reports to electronic D&I tracking of AHLTA-T/SAMS encounters
    • Develop D&I report, including Fever and Respiratory categories
  – Units who wish to continue to report via xls spreadsheet - templates and reporting guidance can be found at: website
Navy Influenza Surveillance Activities

• NHRC FRI program
  – Includes recruit training centers and participating ships
  – Describe circulating respiratory pathogens, including influenza
  – Identify pathogens in support of outbreaks
  – Contributes to FDA’s VRBPAC discussion for development of next year’s influenza vaccine
  – Contact NHRC at nhrc-fri@med.navy.mil for more information and to receive routine reports

• Can describe ILI outbreaks, anticipate duration of illness, describe extent of outbreak, and identify patterns to curtail disease spread
Navy Influenza Surveillance Activities

- Weekly SITREP including:
  - Vaccination rates
  - Overall flu burden
  - Active Duty/recruit burden
  - Description of hospitalized and outpatient cases and trends
  - Noteworthy information in the open media

- Other reports to track vaccine use and disease burden for BUMED

- For more information and to access the latest SITREP, email: usn.hampton-roads.navmcpubhlthcenspors.list.nmcphc-epi@mail.mil
Navy Influenza Surveillance Activities

- NMCPHC Seasonal Influenza Advisory:
  - Navy flu reporting requirements in DRSi
  - Surveillance recommendations for upcoming season
  - Includes guidance on pneumonia surveillance in ESSENCE
  - [http://www.med.navy.mil/sites/nmcphc-program-and-policy-support/Pages/Influenza.aspx](http://www.med.navy.mil/sites/nmcphc-program-and-policy-support/Pages/Influenza.aspx) for more information
Army Influenza Surveillance

- Uses a combination of CHCS Ad Hoc Reporting, DRSi and ESSENCE
- CHCS flat files are sent from each Army lab on a weekly basis to APHC containing all positive and negative results of PCRs, cultures and rapid antigen testing
- Army influenza reports can be found at: https://tiny.army.mil/r/GwOFk/APHCInfluenzaReport
